

MESSAGING SYSTEM
HAVING RECIPIENT PROFILING

Abstract of the Invention

An information system includes a plurality of messaging systems, a data
5 center and a control system. The plurality of messaging systems process
respective messages intended for recipients. The data center is in operative
communication with the plurality of messaging systems and stores transaction
data associated with each respective message. The control system is in
operative communication with the data center. The control system identifies
10 selected transaction data from among the transaction data corresponding to a
defined recipient and uses the selected transaction data to generate a recipient
profile of messages intended for the defined recipient that have been processed
by the plurality of messaging systems.
